AIH5571 — Individual Assignment 1

PROMPT RECORD · Build Your Website — Introduce Yourself

LI YIXUAN（李怡璇） | Arena AI Agent Mode | 12 October 2026

Stage and source	Prompt / instruction	Refinement and result
1 — User ’ s original portfolio brief, paraphrased	Adapt the existing portfolio using the supplied personal materials. Retain its locker-based visual concept, Chinese – English mix and the original creator ’ s credit.	The existing portfolio and its real work samples became the content and visual source rather than a new generic self-introduction template.
2 — User ’ s factual corrections, consolidated	Use the English name exactly as `LI YIXUAN`; retain the attribution to momo; do not invent gender or current city; keep personal claims grounded in the supplied materials.	The portfolio ’ s name, biography and credit were kept within those boundaries. Unsupported personal details were omitted.
3 — Assignment brief from the user	Exact user wording: “ 按照这个准备文件 ”. The supplied specification requires (A) a one-page `index.html`, with CSS and JavaScript in that file, or a ZIP containing the HTML and its assets; and (B) a separate prompt record in Markdown, DOCX or PDF.	The assignment format was treated as a packaging requirement, not a request to replace the student ’ s current portfolio with unrelated content.
4 — User ’ s correction after the first draft	Exact user wording: “ 但是这个index.html根本不能打开我现在的这个网页呀 ”（“ But this index.html cannot open my current webpage at all. ”）, followed by the current GitHub Pages URL: `https://xuanleeeeeeee-lyx.github.io/locker-folio/`.	This clarified that the website deliverable must correspond to the student ’ s actual published portfolio. The earlier simplified page was not the right website for the submission and was replaced by a package built from the current portfolio source.
5 — AI implementation plan, derived from the brief (not a direct user quote)	Convert the current multi-file site into a single `index.html` with inline CSS and JavaScript; ensure the page works without Vite source files or external CSS/JavaScript; preserve the original content and interactions.	The existing current-site build was bundled into the HTML rather than replaced with a different portfolio. The first package used relative assets, which still depended on the extracted asset folder being available to the browser.
6 — User ’ s usability correction	User report, condensed: after downloading, opening `index.html` showed only the initial progress bar; the Prompt Record was also missing, so the user asked for a PDF.	The packaging was revised again: local images, the favicon and the Latin font files are embedded as data URLs inside the single HTML so the page does not have to fetch sibling files. A PDF export of this record was prepared.
7 — Offline and attribution refinement	Avoid external CSS/JavaScript/font-CDN dependencies where practical; keep creator attribution and use the site ’ s existing images and information.	The final website ZIP contains the self-contained `index.html` plus the font-license notice. The website code itself has no external stylesheet or JavaScript dependency. The original PDFs are not included.

Verification performed

- Built from the source corresponding to the current GitHub Pages portfolio, not from the earlier simplified draft.
- Confirmed that all page CSS and JavaScript are inline in `index.html`; no external stylesheet or script bundle is required.
- Embedded 128 portfolio images, the favicon and 13 Latin font files in the HTML; the ZIP no longer relies on an adjacent image directory to start the page.
- Checked the inline JavaScript syntax and verified the archive structure and file integrity.
- Kept the `LI YIXUAN` name, existing portfolio information and momo attribution. No original CV or portfolio PDF is bundled.

Reflection: responsible and effective use of generative AI

Generative AI helped inspect the assignment requirements, convert the existing multi-file portfolio build into a single-HTML deliverable, and check that the CSS, JavaScript and media could be packaged together. The student ’ s correction was essential: the first simplified draft was not the existing website, and the next relative-asset package still did not open fully in the student ’ s environment. Those reports prompted further refinement instead of treating an incomplete output as finished.

AI was used as a coding and packaging assistant, not as a source of personal facts. The existing portfolio content and project images were retained, the requested name and factual limits were followed, and the original visual-concept credit to momo remains. The original CV and portfolio PDFs were excluded. Local font files are accompanied by their licences; Chinese text uses local system-font fallbacks.

The student should still review the final wording, factual claims, image permissions and external project links before submission. The student remains responsible for testing and submitting the final work; AI assistance does not replace that judgement.
